

## Tattoo Protection Spray

safe and clinically tested

**Sprayttoo®** is a effect product that has been designed for use on freshly tattooed skin:

The **Sprayttoo®** spray, reduces water loss from the skin surface and thereby keeps the skin smooth.

The **Sprayttoo®** spray creates a barrier that protects intact and irritated skin.

The **Sprayttoo®** spray reduces friction and keeps the skin pliable. The barrier effect soothes and protects sensitive skin from damage.

It also protects chapped, dry and cracked skin from further damage.

The **Sprayttoo®** spray is easy to apply to the skin without risk for cross-contamination by its non-contact feature.

## Skin Health

## The sterile tattoo spray

**Sprayttoo®** is a spray specially formulated for use on freshly tattooed skin.

Its performance in terms of effectiveness is safe and clinically tested.

**Sprayttoo®** protects and supports the healing of freshly tattooed skin.

**Sprayttoo®** works multi-functionally:

- ✓ It provides a thin barrier which protects the skin from environmental irritants.
- ✓ That barrier also reduces the trans-epidermal water loss and this way hydrates and reinforces the epidermis.
- ✓ It is a spray for a non-contact application, therefore any risk of microbiological cross-contamination of the skin is excluded, compared to the use of ointments or creams.
- ✓ It is sterile and remains sterile during use, therefore any risk of bacterial contamination of the skin is excluded, compared to the use of ointments or creams.

Formulation specially developed for use on freshly tattooed skin:

- ✓ no allergens
- ✓ no synthetic preservatives
- ✓ no parabens
- ✓ no PEG emulsifiers
- ✓ no synthetic dyes
- ✓ no synthetic fragrances
- ✓ no alcohol
- ✓ no water

The functionality of **Sprayttoo®**:

Tattoos are made by injecting ink pigments into the dermis, which is located beneath the epidermis. To this end, the needle needs to penetrate the epidermis, creating micro holes by about a millimeter. The epidermis results wounded and fragile. Thus with freshly tattooed skin any environmental irritant can easily enter the epidermis and cause a bacterial infection.

Here is where **Sprayttoo®** comes into action: the ultra-fine spray application of Sprayttoo ensures that the freshly tattooed skin is coated with a thin protective layer.

This way **Sprayttoo®** acts like a barrier on the top of the epidermis in three ways:

- ✓ It protects the epidermis from environmental irritants and avoids that the tattooed skin gets bacterially infected.
- ✓ Additionally, the **Sprayttoo®** barrier keeps the water, which normally passes from inside the human body to the outside via diffusion and evaporation, trapped in the epidermis. This way **Sprayttoo®** hydrates and reinforces the epidermis, enabling its fast and safe recovery.
- ✓ Soothing damaged skin, as well as protection for further skin damages like friction, chapped skin and cracked skin.

microholes created by tattooing

Advantages of **Sprayttoo®** compared to common tattoo aftercare products:

- ✓ Its performance in terms of medical functionality is safe and tested.
- ✓ Applied by ultra-fine spraying, ensuring state-of-the-art compliance for use on freshly tattooed skin: no clog of pores, no suffocating.
- ✓ No risk of microbiological cross-contamination of the skin which might occur by use of the fingers for spreading ointments or creams.
- ✓ Remains sterile during use, therefore no risk of bacterial contamination of the skin, compared to the use of ointments or creams.

**Ingredients:** White Soft Paraffin BP, Light Liquid Paraffin BP, Hexamethyldisiloxane (volatile silicone).

**Recommendations for use:** Carefully apply to the affected areas.

**Sprayttoo®** is easy to apply: spray the skin lightly from a distance of 10-15 cm, applying a thin layer. Can be used at any angle.
